

TECHSHIP INTERNSHIP

Day1-Introduction to Web Development

Submitted By : Kelna Sebastian

Date : 01-06-2026

During the first day of the TECHSHIP Internship Program, I learned about the fundamentals of web development. Web development involves creating and maintaining websites and web applications that people use every day. I also learned that web development is divided into two main areas: frontend and backend development. Frontend development focuses on the visual and interactive parts of a website using technologies such as HTML, CSS, and JavaScript, while backend development handles server-side operations, databases, authentication, and APIs using technologies like Node.js and MongoDB. Another important topic I studied was JavaScript and its role in modern web development. JavaScript helps make websites interactive and dynamic by enabling features such as form validation, content updates, and user interactions. Overall, this session helped me understand the basic concepts of how modern websites work and the technologies used to build them.

The screenshot displays the Visual Studio Code (VS Code) interface. The Explorer panel on the left shows a project structure with a folder named 'TECHSHIP' containing a sub-folder 'Day1', which in turn contains a file named 'day1.js'. The main editor area shows the content of 'day1.js', which consists of four lines of JavaScript code using `console.log` to print out personal and institutional information. Below the editor, the TERMINAL panel is active, showing the command `D:\TECHSHIP\Day1>node day1.js` and its output, which matches the content of the `console.log` statements in the script. The status bar at the bottom indicates the current position is at line 4, column 36, with 4 spaces, in UTF-8 encoding with CRLF line endings, editing a JavaScript file.
