

TECHSHIP INTERNSHIP

Day 4- DOM Manipulation,Events & Form Handling

Submitted By : Kelna Sebastian

Date : 04-06-2026

On Day 4, I learned how to use the Document Object Model (DOM) to make web pages interactive using JavaScript. Through the exercises, I practiced selecting HTML elements, handling button clicks, changing webpage content, switching themes, and creating dynamic lists. In the assignment, I developed a Student Registration Form with validation for name, email, phone number, college, and course fields.

The most challenging part was implementing form validation and ensuring that appropriate error messages were displayed for invalid inputs. I also learned how to prevent the form from refreshing using `preventDefault()` and how to display submitted information dynamically in a student details card. Overall, this session helped me understand how JavaScript, HTML, and CSS work together to create responsive and interactive web applications.
